ABSTRACT

This report presents detailed information on the marital status and living arrangements of the noninstitutional population of the United States by age, sex, race, and Spanish origin. The text of this report compares the mid-decade census estimates based on the March, 1985 "Current Population Survey" with the survey data from 1980, 1970, and 1960. The report concludes that many changes in marital status and living arrangements have occurred over the last few decades. Changes in marital status include postponement of the first marriage; a growing proportion of never-married persons; and the growth of the "singles" population due to divorce and separation. Changes in living arrangements include increasing numbers of children who live in single-parent situations, of young adults who live with their parents, of persons who live alone, and of adults who reside in unmarried couple households. Highlights of the report are: during the 1980s, the proportion of never married women, aged 20 to 24, has been the largest ever recorded; there were 119 unmarried men aged 25 to 34 for every 100 women aged 25 to 34 in 1985; between 1970 and 1985 the divorce ratio rose from 47 to 128 divorced persons per 1,000 married persons with spouse present; and 23 percent of children under 18 lived with one parent in 1985, compared with 9 percent in 1960. In addition, 60 percent of men and 48 percent of women, aged 18 to 24, lived at home with their parents in 1985; most elderly men still lived with their wives, while elderly women were more likely to live alone than with their husbands in 1985. The rapid growth in unmarried couple household during the 1970s has slowed in recent years. Charts, tables, and appendix tables which pertain to the data are included in the document. (APG)

Marital Status and Living Arrangements: March 1985

INTRODUCTION

This report presents detailed information on the marital status and living arrangements of the noninstitutional population of the United States, by age, sex, race, and Spanish origin. The text of this report compares these mid-decade estimates based on the March 1985 Current Population Survey with survey data from 1980, 1970, and 1960. Data from past decennial censuses are used where survey data are not available.

Many changes in marital status and living arrangements have occurred over the last few decades. Changes in marital status include postponement of first marriage, a growing proportion of never married persons, and an additional growth in ''singles'' due to divorce and separation. Changes in living arrangements include increased proportions of children who live in single-parent situations, of young adults who live with their parents, of persons who live alone, and of adults who reside in unmarried-couple households. Some highlights discussed in this report include:

- During the 1980's, the proportion of women aged 20 to 24 years who had never married has been the largest ever recorded.
- There were 119 unmarried men aged 25 to 34 years for every 100 unmarried women aged 25 to 34 years in 1985.
- Between 1970 and 1985, the divorce ratio rose from 47 to 128 divorced persons per 1,000 married persons with spouse present.
- Twenty-three percent of children under 18 years lived with one parent in 1985, compared with 9 percent in 1960.
- Sixty percent of men and 48 percent of women aged 18 to 24 years lived at home with their parents in 1985.
- Most elderly men still lived with their wives while elderly women are somewhat more likely to live alone than with their husbands in 1985.
- The rapid growth in unmarried-couple households during the 1970's has slowed in recent years.

AGE AT FIRST MARRIAGE

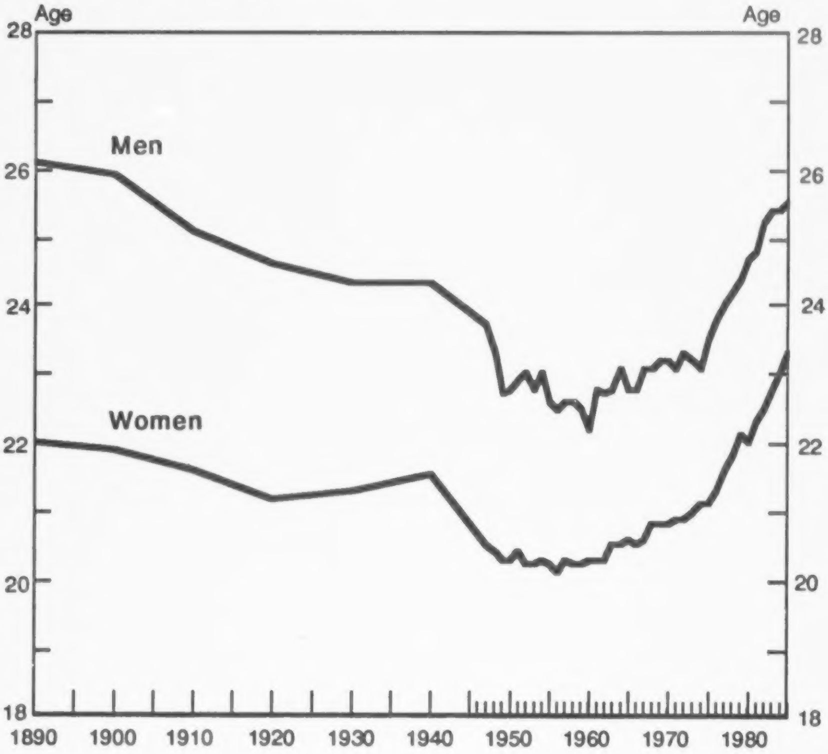
The estimated median age at first marriage in 1985 was 23.3 years for women and 25.5 years for men. During the 1980's the median age at first marriage for women has continued to be higher than any previously recorded level. Men are nearing the level recorded in 1890, 26.1 years. At the beginning of the 20th century, the median age at first marriage started a decline that ended in the mid-1950's, reaching a low of 20.1 years for women and 22.5 years for men. Since that time the estimated median age has been rising, with especially rapid increases occurring during the past 10 years. Between 1975 and 1985 the median age has risen 2 full years for both men and women, after increasing by only about 1 year during the 20 years spanning 1955 and 1975.

The gap between men and women in the median age at first marriage has narrowed substantially during the last 95 years. The 4-year difference in 1890 had narrowed to about a 2-year difference in 1985.

Figure 1 plots the estimates of median age at first marriage which are presented in table A-1, that is, estimates for 10-year intervals from 1890 to 1940, and annual estimates from 1940 to 1985.

FIGURE 1.

Median Age at First Marriage, by Sex: 1890 to 1985



Source: Table A-1.

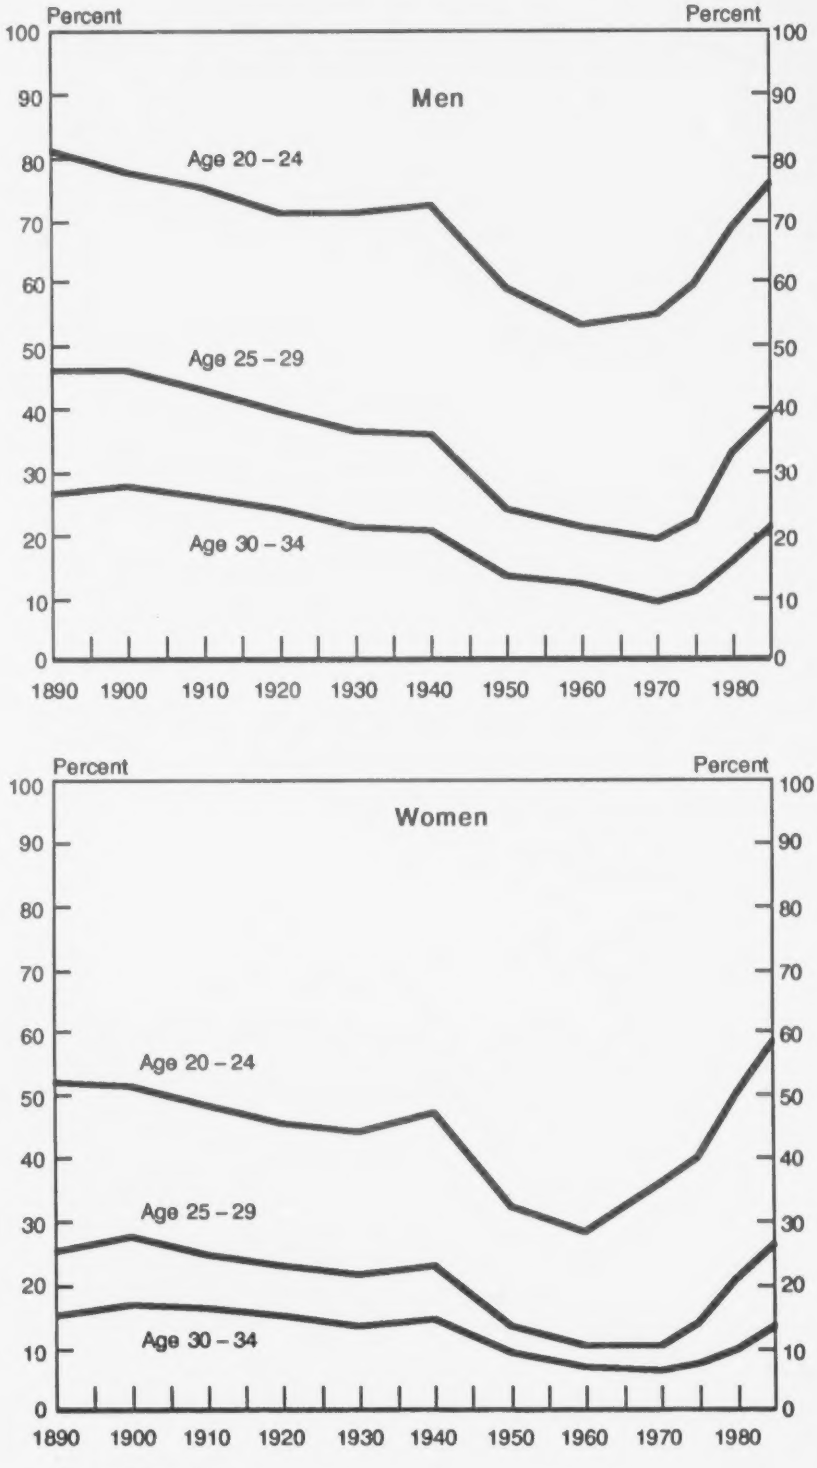
PERCENT SINGLE

The proportions of men and women who have never married followed patterns of change over the last decade parallel to those for median age at first marriage. By 1985, the proportion of women in their twenties and early thirties who had never married was at a level near the previous high recorded around the turn of the century. In fact, the percentage of women age 20 to 24 years who had not yet married has been larger during the 1980's than ever recorded, 59 percent in 1985 versus the previous high of 52 percent in 1890. Between 1890 and 1960 the proportion never married for women declined by about one-half for the age groups 20 to 24, 25 to 29, and 30 to 34, but by 1985 the proportions had approached or exceeded turn-of-the-century levels. Women in their late twenties and early thirties experienced little or no change between 1960 and 1970, but rapid increases occurred between 1970 and 1985. The proportion rose from 11 to 26 percent for women 25 to 29 years, and from 6 to 14 percent for the age group 30 to 34 years. The proportion of men who had never married rose between 1970 and 1985 from 55 to 76 percent for age 20 to 24, from 19 to 39 percent for age 25 to 29, and from 9 to 21 percent for age 30 to 34.

The high proportions of persons in their twenties and thirties who are currently single implies that, if these persons subsequently marry, the median age at first marriage will continue to increase in the future. Figure 2 plots the estimates of the proportion never married which are presented in table A-3, that is, estimates for 10-year intervals.

FIGURE 2.

Percent Never Married for Men and Women 20 to 34 Years Old: 1890 to 1985



Source: Table A-3.

RATIO OF MEN TO WOMEN

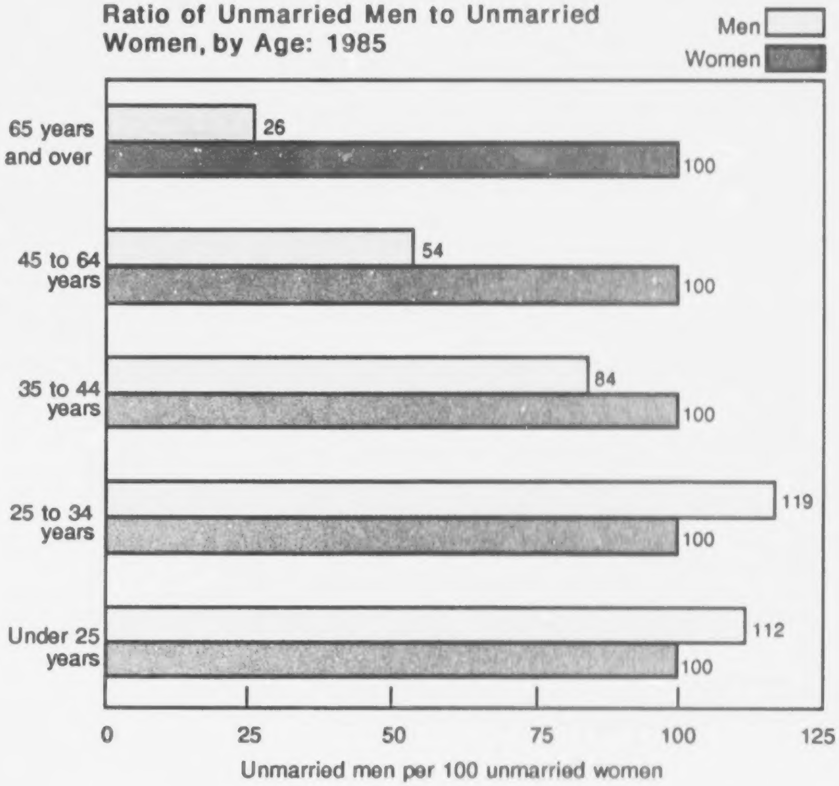
The ratio of unmarried men to unmarried women is much larger at younger ages, suggesting that the marriage prospects for younger women are better than for older women. Overall, in 1985 there were about 4 unmarried men for every 5 unmarried women. (Unmarried includes never married, widowed, and divorced persons.) However, the ratio was much smaller for persons 45 years of age and older than it was for younger persons. In fact, at peak marrying ages, unmarried men outnumber unmarried women. For young adults age 15 to 24 years, there were 112 unmarried men for every 100 unmarried women. Young adults age 25 to 34 had a ratio of 119 unmarried men for every 100 unmarried women.[1] However, at older ages the ratio becomes smaller. At age 35 to 44, there were 84 unmarried men per 100 unmarried women, and this drops to 54 per 100 for the age group 45 to 64 years, and to 26 per 100 by age 65 and over.

---

[1] The ratio of unmarried men to unmarried women for 15-to-24-year-olds was not significantly different from 25-to-34-year-olds.

FIGURE 3.

Ratio of Unmarried Men to Unmarried Women, by Age: 1985



Source: Table A-4.

DIVORCE RATIO

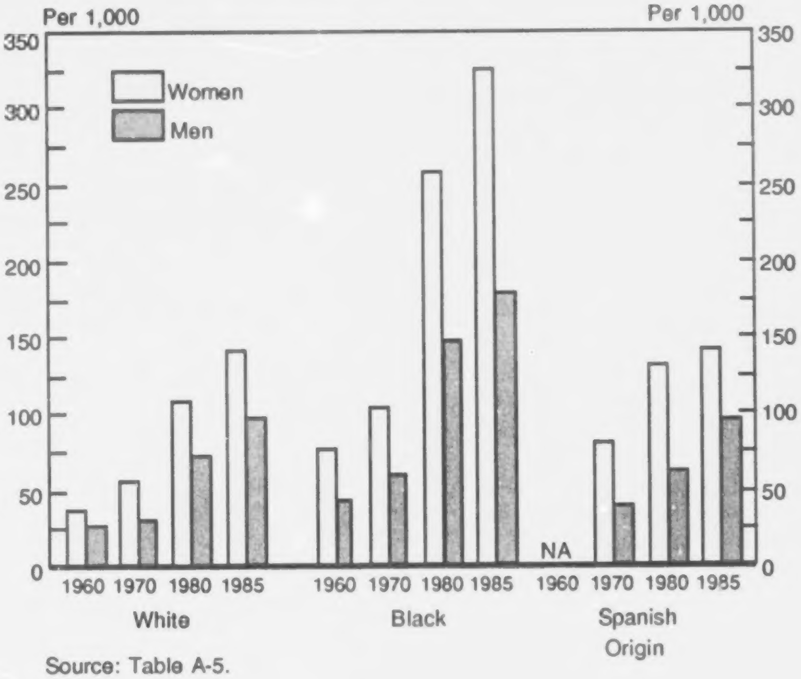
Marital disruption through divorce results in another form of "singleness" experienced by many adults. In 1985 there were 128 divorced persons for every 1,000 married persons living with their spouses, more than 2½ times the figure of 47 in 1970. This divorce ratio is a useful index for monitoring the growth in the divorced population relative to the number of persons in intact marriages.

The divorce ratio for men is significantly lower than for women (103 versus 153 per 1,000) since men are more likely to remarry after divorce and to do so more quickly. Black women have the highest ratio (326 in 1985) of any sex or race group, followed by 179 per 1,000 for Black men. The ratios for Whites are not statistically different from the ratios for persons of Spanish origin, 98 and 97 for men and 142 and 143 for women, respectively.

The annual divorce rate published by the National Center for Health Statistics (NCHS) differs from the divorce ratio, as described above, in that the divorce rate is the number of divorces that are granted in a given year per 1,000 population. The divorce rate, as reported by NCHS, has declined slightly during the last few years. The divorce ratio, however, is the number of all currently divorced persons (those who had divorced during any month and year before March 1, 1985, and who had not remarried before March 1, 1985) per 1,000 married persons who live with their spouse. The ratio has continued to increase during recent years, because the total number of divorced persons has continued to increase more rapidly than the total number of married persons.

FIGURE 4.

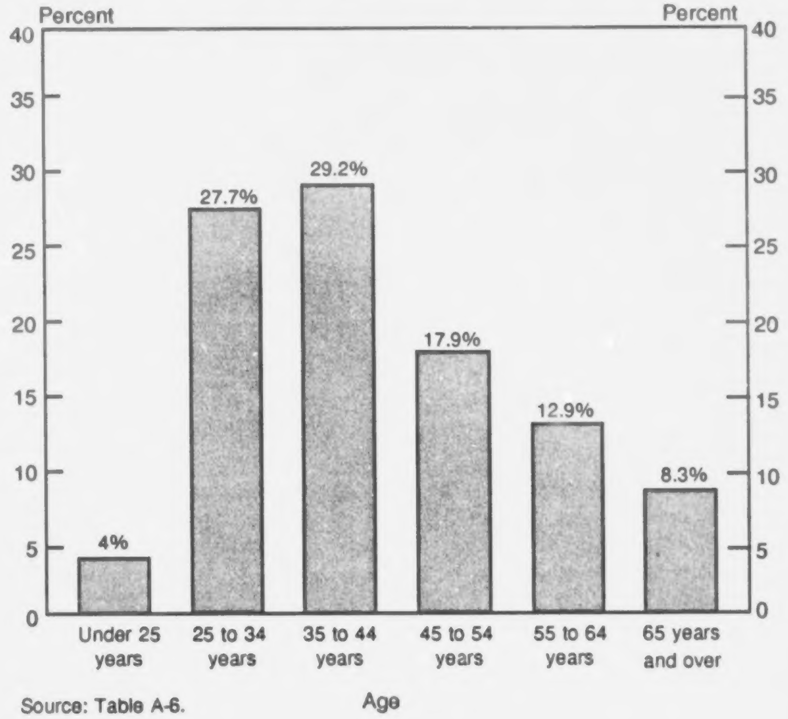
The Ratio of Divorced Persons Per 1,000 Married Persons With Spouse Present: 1985, 1980, 1970, and 1960



Source: Table A-5.

FIGURE 5.

Percent Divorced, by Age: 1985



Source: Table A-6.

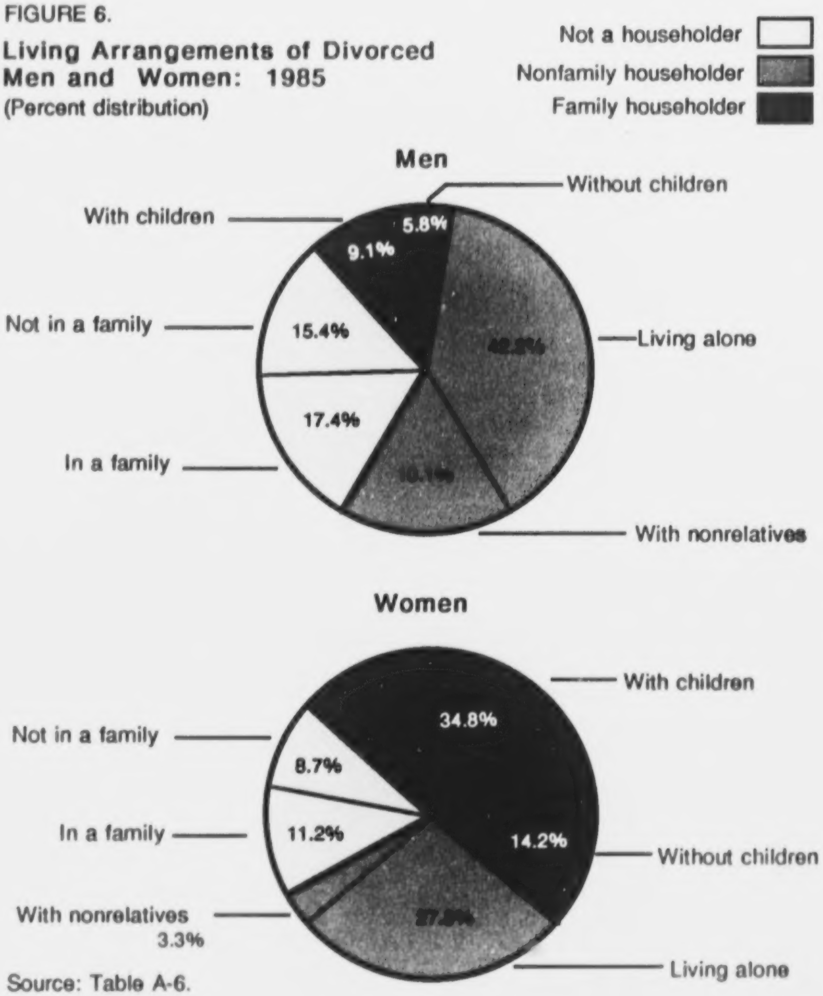
LIVING ARRANGEMENTS OF DIVORCED PERSONS

There were 7.8 million divorced women and 5.3 million divorced men in 1985. Most were between 25 and 44 years old (55 percent for women and 60 percent for men). The living arrangements of these divorced persons differ by sex. Women are more likely to maintain a household of their own, and are more likely to have their children present. Men, however, are more likely to live alone.

One-half of all divorced women maintained a family household (35 percent as a single parent, and 14 percent without children present), 28 percent lived alone, and 3 percent shared their home with unrelated persons, while 20 percent lived in the home of someone else (11 percent with relatives). The corresponding proportions for men were 15 percent maintaining a family household (9 percent as single parents and 6 percent without children present), 42 percent living alone, 10 percent sharing their home with nonrelatives, and 33 percent living in the home of someone else (17 percent with relatives).

FIGURE 6.

Living Arrangements of Divorced Men and Women: 1985
(Percent distribution)



Source: Table A-6.

LIVING ALONE

In 1985, 20.6 million persons lived alone. These persons accounted for 11 percent of all adults, and their one-person households accounted for 24 percent of all households. Since 1960 the number of persons living alone has nearly tripled, but the increase has slowed in recent years. Between 1980 and 1985 the number of men living alone increased by 13 percent, compared with an increase of 97 percent during the 1970's and a 34-percent increase during the 1960's. The number of women living alone increased by 12 percent since 1980, compared with increases of 65 and 55 percent in the decades of the 1960's and 1970's, respectively. Women constitute the majority (62 percent) of persons who live alone, and they tend to be older than men who live alone. Out of 12.7 million women who lived alone, in 1985, 43 percent were widows 65 years and over, compared with only 12 percent of the 7.9 million men who lived alone. In 1985, the median age of women living alone was 65.5 years. The median age for men living alone was 41.4 in 1985, 24 years younger than for women. Although the median age for men living alone in 1985 was no different than in 1980, the median age fell from 55.7 to 40.9 years between 1970 and 1980.

Figure 8 plots the estimates of median age of men and women living alone which are presented in table A-7, that is, estimates for 1960, 1970, 1980, and 1985.

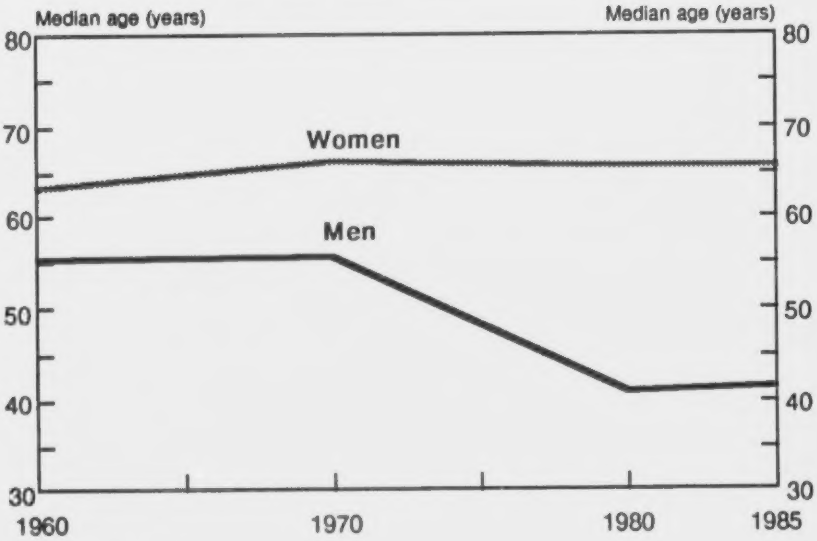
FIGURE 8.

Median Age of Men and Women Living Alone: 1985, 1980, 1970, and 1960



Source: Table A-7.

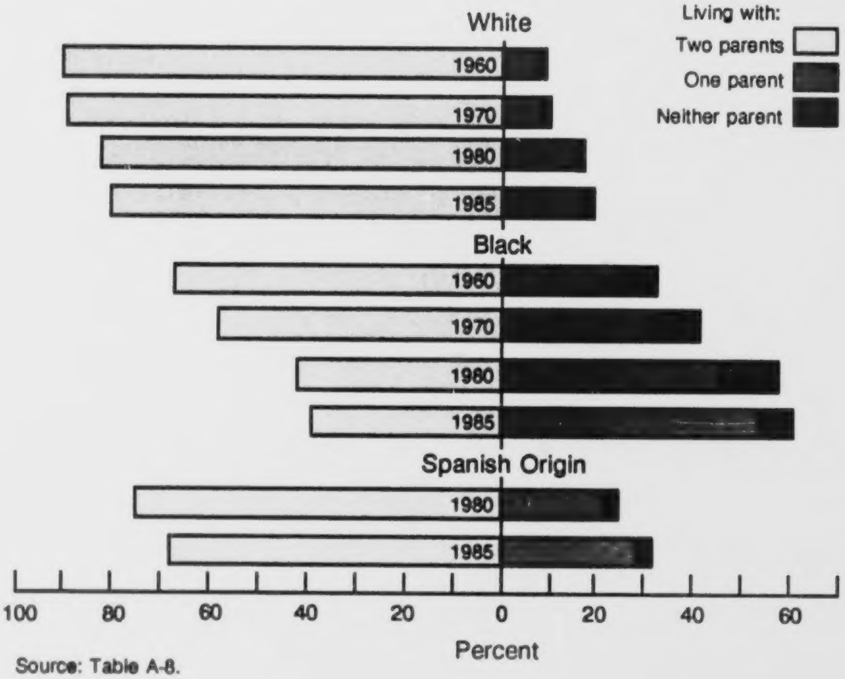
CHILDREN UNDER 18 YEARS

The living arrangements of children are influenced by changes in the marital status of adults. As increases occur in the proportion of never-married adults at the prime childbearing ages, and in the ratio of divorced persons to persons who are married, spouse present, a smaller proportion of children are living with two parents and an increasing proportion are living with one parent.

Out of 62.5 million children under 18 years in 1985, 14.6 million, or 23 percent, lived with only one parent, compared with 9 percent in 1960 and 12 percent in 1970. Nine out of 10 children in a single-parent situation lived with the mother. (See table A-8.) Black children had the highest proportion living with one parent, 54 percent versus 18 percent for White children and 29 percent for children of Spanish origin. In 1985, the proportion of Black children living with someone other than a parent was less than in the past, 7 percent in 1985, compared with 12 percent in 1980 and 11 percent in 1960.

FIGURE 9.

Living Arrangements of Children Under 18 Years: 1985, 1980, 1970, and 1960



Source: Table A-8.

CHILDREN LIVING WITH ONE PARENT

In 1985, 52 percent of White children in one-parent situations lived with a divorced parent, 23 percent with a separated parent, 13 percent with a never-married parent, and 8 percent with a widowed parent. In 1960, roughly equal proportions of White children lived with a divorced or widowed parent (28 and 29 percent, respectively).

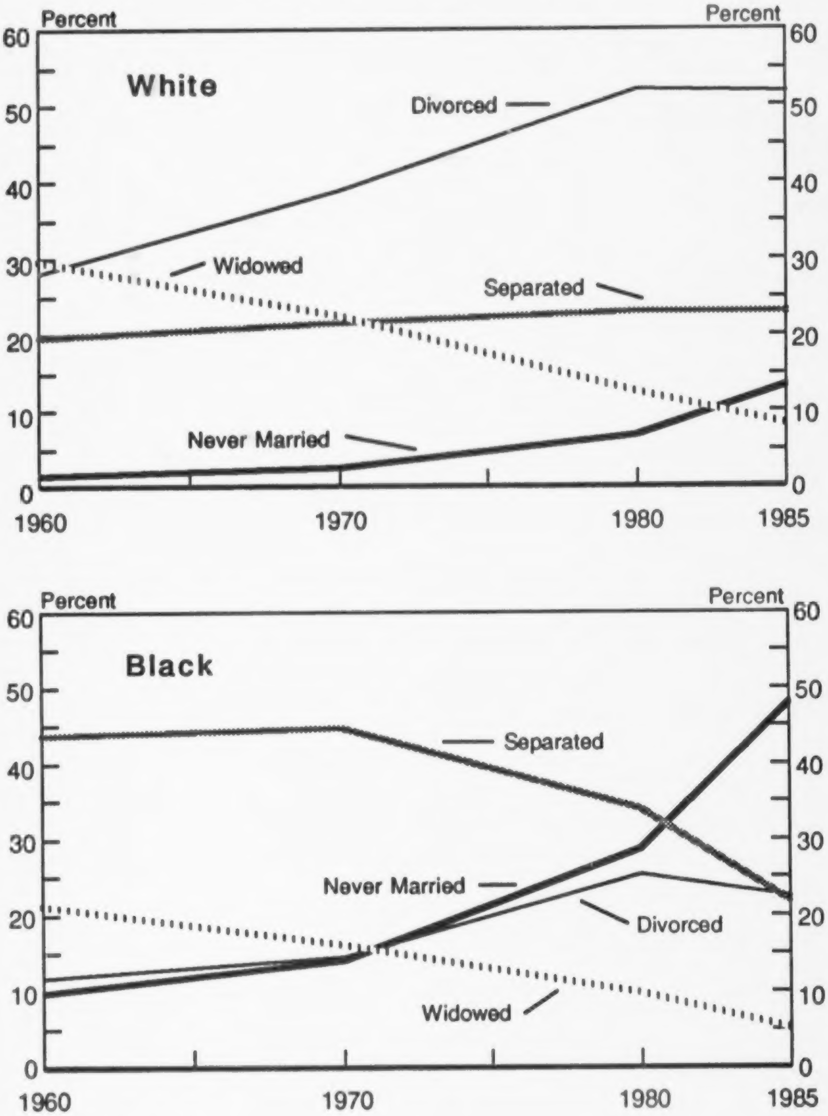
However, since 1960 the divorced proportion has risen to 52 percent while the widowed proportion has dropped to 8 percent. White children who lived with a married parent whose spouse was absent for some reason other than marital discord (spouse away on business, in the Armed Forces, etc.), referred to in figure 10 as "Other," declined from 21 percent in 1960 to 3 percent in 1985. The proportion who lived with a parent who had never been married increased from 7 percent to 13 percent during the last 5 years (from 1980 to 1985).

The percent of Black children in one-parent situations who lived with a never-married or divorced parent has risen since 1960, from 10 to 48 percent for never-married parents and from 12 to 23 percent for divorced parents. The percent who lived with a separated parent made up the largest proportion in 1960 (44 percent) and declined to 22 percent by 1985.

In 1985, the largest proportion of children of Spanish origin lived with a separated parent (37 percent). Data on children of Spanish origin by marital status of parent were not available in 1960 or 1970.

FIGURE 10.

Children Under 18 Years Living With One Parent, by Marital Status of Parent: 1985, 1980, 1970, and 1960



Source: Table A-9.

CHILDREN BY CHARACTERISTICS OF THE PARENTS

The demographic and economic conditions under which children live vary depending upon race and number of parents present. (See table A-10.) Children living with two parents are more likely to be living with a parent who has at least some college, who is employed, who has higher income, and who is a homeowner than are children in a single-parent situation.

White children are most likely to be living with a parent with 1 or more years of college, and Black children next most likely and children of Spanish origin are least likely to live with such a parent. For children in one-parent situations, the proportion with a parent who is unemployed or not in the labor force is high regardless of race or Spanish origin, but the proportion is higher for Black children (58 percent) and children of Spanish origin (61 percent) than for White children (40 percent).[2] Among children living with both parents, 11 percent of White children lived with a parent who was unemployed or not in the labor force, compared with 21 percent for Black, and 19 percent for children of Spanish origin.[3] When both parents are present, White children are less likely to have other adults present than Black children or children of Spanish origin. When only one parent is present, they are equally likely to have other adults present.

Family income is higher for White children. One-half of all White children with two parents had family incomes of $30,000 or more, compared to 35 percent for Black children and 28 percent for children of Spanish origin. Among children with one parent, 70 percent of Black children and children of Spanish origin had family incomes of under $10,000, compared with 49 percent for White children. White children are less likely to live in rented housing. For children with 2 parents present, 25 percent of the White children live in rented housing as compared with 41 percent for Black children and 50 percent for children of Spanish origin. For children living with one parent, the corresponding proportions are 56 percent, 75 percent, and 79 percent, respectively.[4]

---

[2] The difference in the proportions of Black children and children of Spanish origin is not statistically significant.

[3] Ibid.

[4] Ibid.

LIVING ARRANGEMENTS OF YOUNG ADULTS

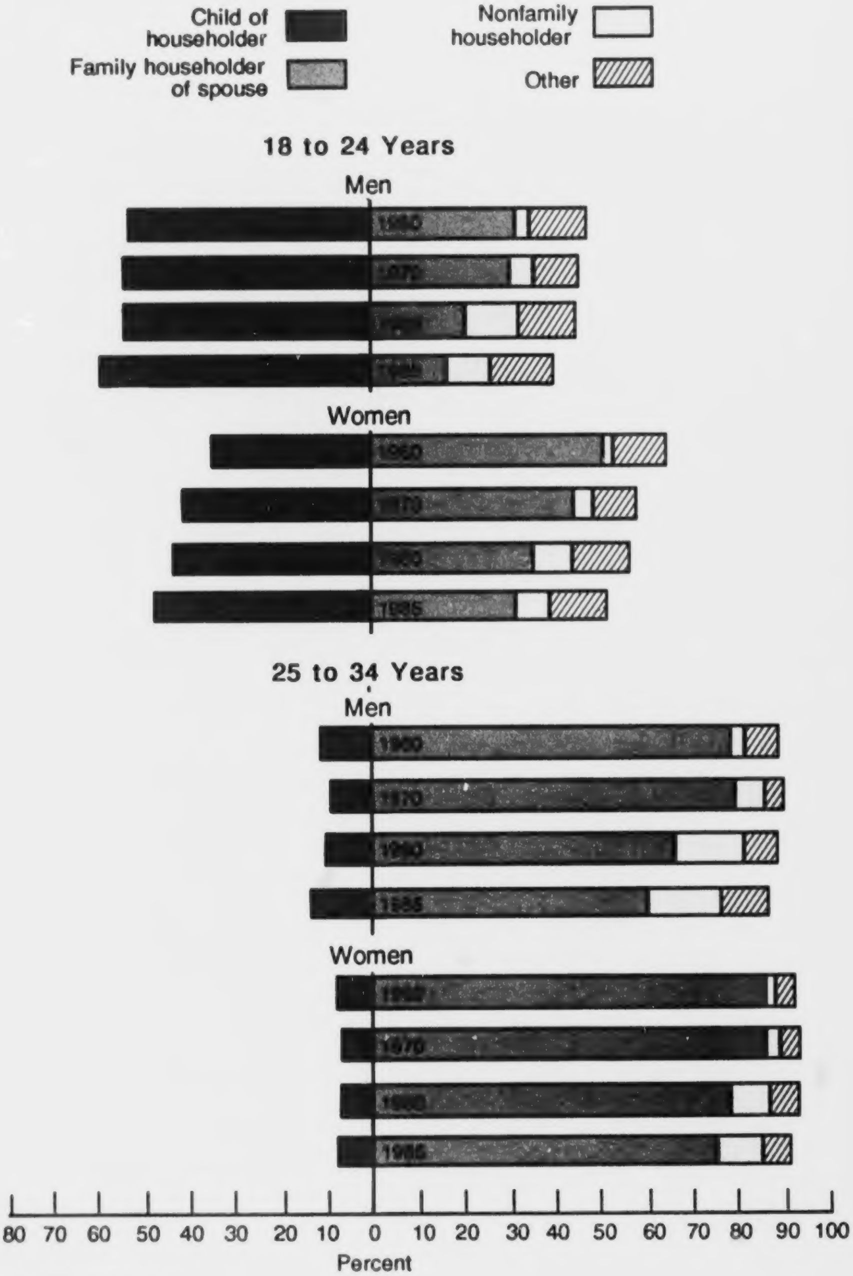
Among young adults age 18 to 24 years in 1985, 60 percent of the men and 48 percent of the women lived at home with their parents (including unmarried college students living in dormitories), compared with 52 percent of young men and 35 percent of young women in 1960. For men, this proportion increased by about 2 percentage points during the 20 years from 1960 to 1980, and it increased an additional 5 percentage points during the 5 years since 1980. For women, the proportion rose by 8 percentage points during the 20 years between 1960 and 1980, and then rose by 5 percentage points between 1980 and 1985.

Corresponding to the rise in young adults 18 to 24 years living at home is the decline in the proportion living in households of their own. The decline in the proportion of young men maintaining a family began in the 1970's with a drop from 30 percent in 1970 to 16 percent in 1985, while the decline for young women has been occurring since 1960 when more than one-half of all women age 18 to 24 were maintaining families as either householder or spouse, compared with 32 percent in 1985.

Among "older" young adults (25 to 34 years) the proportion who lived in their parents' home did not increase until recently. For men, nearly the same proportion lived with their parents in 1980 as in 1960, but then increased slightly from 10.5 to 13.3 percent between 1980 and 1985. The proportion of women 25 to 34 years living in their parents' home declined slightly between 1960 and 1970, but then during the next 15 years rose gradually from 6.6 to 8.0 percent by 1985.

FIGURE 11.

Living Arrangements of Young Adults: 1985, 1980, 1970, and 1960



Source: Table A-11.

LIVING ARRANGEMENTS OF THE ELDERLY

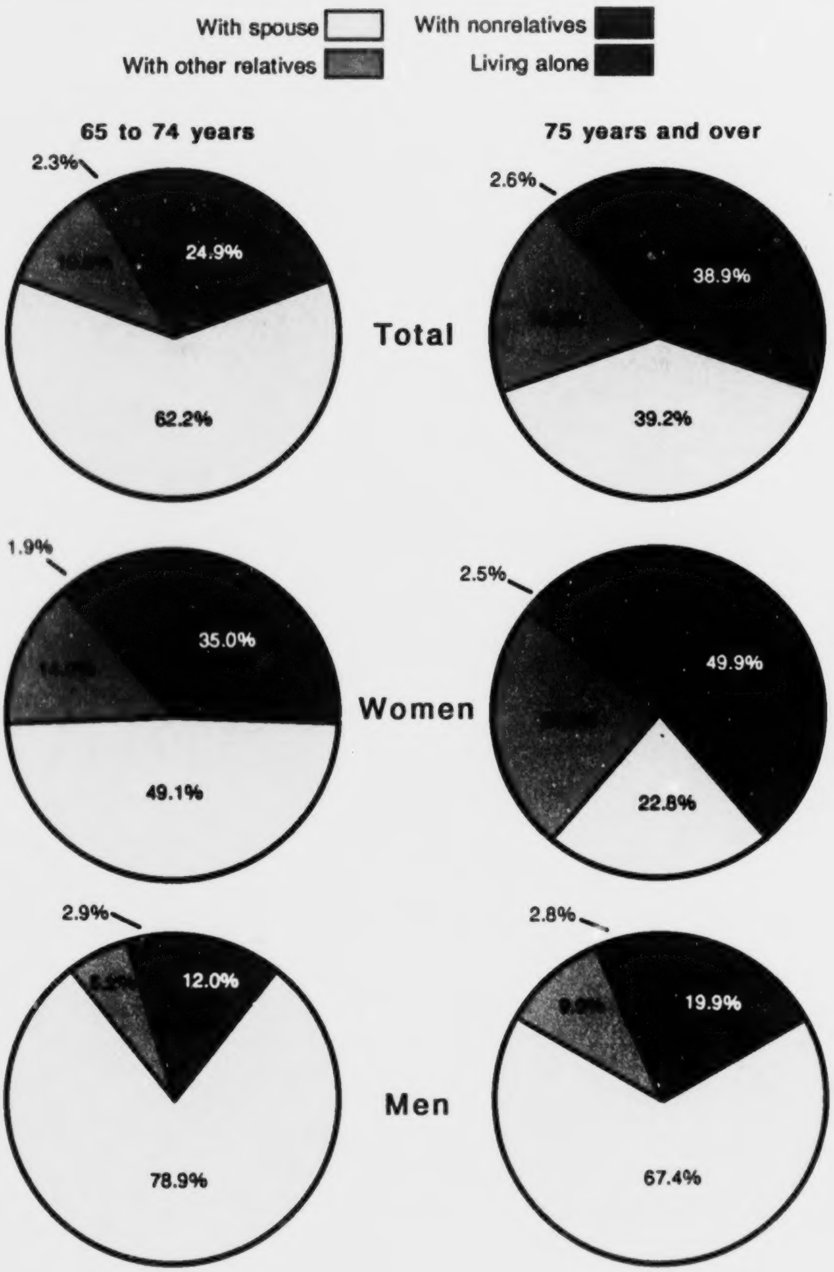
Living arrangements of the elderly noninstitutional population vary by age and by sex. At age 65 to 74 years, the majority (62 percent) of persons are married and living with their spouse, about one-fourth live alone, and 11 percent live with other relatives. For persons 75 years and older, many have been widowed, with the result that a larger proportion live alone (38 percent) or with other relatives (19 percent).

The living arrangements of men vary only slightly across the two age groups while significant differences exist for women. Among elderly men, the majority in 1985 lived with their wives (79 percent age 65 to 74 years and 67 percent age 75 and over), and the next largest proportion lived alone (12 percent and 20 percent for the two age groups, respectively). Elderly women, in contrast, are less likely than elderly men to live with their spouses, because of the greater longevity for women, with the result that they are more likely to live alone or with another relative. Only one-half of women age 65 to 74 years lived with their husbands in 1985, and by age 75 or older the proportion declined to slightly less than one-fourth. With increasing age, the proportion of elderly women who lived alone in 1985 rose from 35 percent for women age 65 to 74 years to 50 percent for women age 75 years or older, and the proportion who lived with another relative increased from 14 percent to 25 percent.

FIGURE 12.

Noninstitutional Living Arrangements of the Elderiy: 1985

(Percent distribution)



Source: Table A-12.

In general, since 1960 an increasing proportion of the elderly population has been living alone. Between 1960 and 1980, the proportion of persons age 65 to 74 who lived alone increased from 17 percent to 25 percent, while those living with other relatives declined from 20 percent to 11 percent. For persons 75 years and over the proportion living alone increased from 21 to 39 percent, and the proportion living with other relatives dropped from 36 to 20 percent. No change has occurred in these distributions of living arrangements since 1980.

Information on the institutional population is not collected in the Current Population Survey, but is available from decennial censuses. The institutional population includes persons under care or custody in such places as homes for the aged and hospitals or wards for the physically or mentally handicapped or for chronic disease patients. Based on the results of the 1970 and 1980 censuses, the proportion of the elderly population in institutions increased slightly, from 4.8 percent in 1970 to 5.3 percent in 1980. For persons age 65 to 74 years, 1.8 percent of the men and 1.9 percent of the women were living in institutions in 1980, compared with 2.1 and 2.2 percent in 1970, respectively. For persons 75 years and over, 7.2 percent of the men and 12.5 percent of the women were living in institutions in 1980, compared with 6.7 and 10.8 percent in 1970.

UNMARRIED-COUPLE HOUSEHOLDS

In 1985, there were 1,983,000 unmarried-couple households in the United States, compared with 439,000 in 1960. The number of such households accelerated rapidly during the decade of the 1970's. However, since 1980 the growth has diminished, with no increase at all between 1984 and 1985. Figure 14 plots estimates of the number of unmarried couples with and without children for 1960 and 1970 and for every year between 1977 and 1985.

An unmarried-couple household, as defined by the Census Bureau, is composed of two unrelated adults of the opposite sex, with or without children under 15 years old living in the household. About 70 percent of the unmarried-couple households in 1985 contained no children, compared to 55 percent in 1960. Among those households with no children present, the adults are more youthful than in the past. In 1985, 79 percent of the partners were under 45 years old, compared with 33 percent in 1970 and approximately 20 percent in 1960.

Though the number of unmarried-couple households has grown significantly, these couples account for only 4 percent of all couples, married and unmarried. Bear in mind that while the term "unmarried couple" may be interpreted as implying a close personal relationship between the two adults sharing the household, the Census Bureau does not ask questions regarding the nature of the couple's personal relationship. Many of these households undoubtedly contain persons cohabiting in lieu of marriage, but situations such as an elderly widow who rents a room to a young man attending college also are included in the count of unmarried-couple households.

RELATED REPORTS

Data for 1985, together with historical data back to 1947, on households and families by type were published in Series P-20, No. 402, *Households, Families, Marital Status, and Living Arrangements: March 1985 (Advance Report).* Detailed statistics on household type and composition for 1985 are presented in Series P-20, No. 411, *Household and Family Characteristics: March 1985* (forthcoming). Projections for the United States of the number of households and families were published in Series P-25, No. 986, *Projections of the Number of Households and Families: 1986 to 2000.* Additional statistics for years since 1947 on subjects covered in this report have been published by the Bureau of the Census in other reports in Series P-20, P-23, and P-25 and are listed at the end of this publication.

Statistics on marital status, living arrangements, and related subjects for specific standard metropolitan statistical areas, counties, urbanized areas, cities, States, regions, and the United States are available from the 1980 Census of Population. The data are presented in Volume 1, *Characteristics of the Population,* Chapters B, C, and D.

Appendix B. Definitions and Explanations

Coverage. The population in this report includes the civilian noninstitutional population of the United States plus approximately 925,000 members of the Armed Forces in the United States living off post or with their families on post in 1985 but excludes all other members of the Armed Forces. However, the data in table A on median age at first marriage for men refer to the total male population which includes, in addition to the above, the male members of the Armed Forces overseas and in military barracks and similar quarters in the United States.

Symbols. A dash (-) represents zero or rounds to zero. The symbol "B" means that the base for the derived figure is less than 75,000. An "X" means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Metropolitan-nonmetropolitan residence. Data for metropolitan and nonmetropolitan areas have been omitted from this report. The Current Population Survey was undergoing a major redesign when the data for this report were collected, which affected the estimates of geographic components. The major purpose of the redesign was to make use of data from the 1980 census in order to update the sampling frame, to improve the efficiency and quality of the survey, and to meet the increased need for State data. Technical aspects of the redesign are discussed in appendix C. Publication of metropolitan-nonmetropolitan estimates will resume following the end of redesign phase-in in late 1985.

Age. The age classification is based on the age of the person at the person's last birthday. The adult universe (i.e., population of marriageable age) now comprises persons 15 years old and over. Prior to 1980 the adult universe was 14 years old and over.

Race. The population is divided into three groups on the basis of race: White, Black, and other races. The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. Persons of Spanish origin may be of any race.

Marital status. The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present,""separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. As of 1983, group quarters were defined in the Current Population Survey as noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing ten or more unrelated persons or nine or more persons unrelated to the person in charge. Prior to 1983, group quarters included housing units containing five or more persons unrelated to the person in charge. Beginning in 1972, inmates of institutions have not been included in the Current Population Survey.

Householder. The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Prior to 1980, the husband was always considered the householder in married-couple households. The number of householders is equal to the number of households. Also, the number of family householders is equal to the number of families.

Head versus householder. Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

In this report, the term "householder" is used in the presentation of data that had previously been presented with the designation "head." The householder is the first adult household member listed on the questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If a home is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of other household members is to be recorded.

Family. A family is a group of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family household. A family household is a household maintained by a family (as defined above), and any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there are included. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of family.)

Related subfamily. A related subfamily is a married couple with or without children, or one parent with one or more own single (never married) children under 18 years old, living in a household and related to, but not including, the person or couple who maintains the household. One example of a related subfamily is a young married couple sharing the home of the husband's or wife's parents. The number of related subfamilies is not included in the count of families.

Unrelated subfamily. An unrelated subfamily (formerly called a secondary family) is a group of two persons or more who are related to each other by birth, marriage, or adoption, but who are not related to the householder. The unrelated subfamily may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of unrelated subfamilies. However, the number of such unrelated subfamilies became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

Family group. A family group is any two or more persons (not necessarily including a householder) residing together, and related by birth, marriage, or adoption. A household may be comprised of one such group, more than one, or none at all. The count of family groups includes family households, related subfamilies, and unrelated subfamilies.

Married couple. A married couple, as defined for census purposes, is a husband and wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" or "married-couple" before the term "household," "family," or "subfamily" indicates that the household, family, or subfamily is maintained by a husband and wife. The number of married couples equals the count of married-couple families plus related and unrelated married-couple subfamilies.

Unmarried couple. An unmarried couple is composed of two unrelated adults of the opposite sex (one of whom is the householder) who share a housing unit with or without the presence of children under 15 years old.

Unrelated individuals. Unrelated individuals are persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Nonfamily householder. A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Secondary individual. A secondary individual is a person in a household or group quarters such a guest, roomer, boarder, or resident employee (excluding nonfamily householders and inmates of institutions) who is not related to any other person in the household or group quarters. (See section on unrelated subfamily for slight change in coverage of secondary individuals in 1968.)

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the householder. Similarly, "own" children in a subfamily are sons and daughters of the married couple or parent in the subfamily. (All children shown as members of related subfamilies are own children of the person(s) maintaining the subfamily.) "Related" children in a family include own children and all other children in the household who are related to the householder by birth, marriage, or adoption. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25" and "own children of any age," as the terms are used here, include all children regardless of marital status. The totals include never-married children living away from home in college dormitories.

The count of related children in families was formerly restricted to single (never married) children. However, beginning with data for 1968 the Bureau of the Census includes ever-married children under the category of related children. This change added approximately 20,000 children to the category of related children in March 1968.

Tenure. A housing unit is "owned" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owned" only if the owner or co-owner lives in it. All other occupied units are classified as "rented," including units rented for cash rent and those occupied without payment of cash rent.

Years of school completed. Education of parent, as shown in this report, refers to the years of school completed by the parent (the father when both parents are present). Data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that the person has attended?" and (b) "Did the person finish this grade?"

Labor force and employment status. The definitions of labor force and employment status in this report related to the population 15 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific job-seeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register, (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home house-work, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntary idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Income. Data on income cover money income only, prior to deduction for taxes, received from such sources as wages or salaries, net income from self-employment, Social Security, dividends, interest, public assistance and welfare, unemployment compensation, government pensions, and veterans payments. Certain money receipts such as capital gains are not included. For a more detailed explanation, see Bureau of the Census, Current Population Reports, Series P-60.

Appendix C. Source and Reliability of Estimates

SOURCE OF DATA

The estimates of this report are based primarily on data obtained annually in March of 1947 through 1985 from the Current Population Survey (CPS) and from supplementary questions to the CPS. Additional data were obtained from decennial censuses dating back to 1890. Decennial census data are noted in the text tables in the report. The Current Population Survey and the decennial census are programs conducted by the Bureau of the Census. Supplemental data on divorce rates were obtained from the National Center for Health Statistics (NCHS) of the Department of Health and Human Services (HHS).

Current Population Survey (CPS). The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member in every sample household. In addition, supplementary questions are asked every March about household and family characteristics. In order to obtain more reliable data for the Hispanic population, the March CPS sample was enlarged to include all households from the previous November which contained at least one sample person of Spanish origin. For this report, persons in the Armed Forces living off post or with their families on post are included.

CPS design phase-in. Since the inception of the CPS in 1940, the sample has been redesigned several times, most recently in the early 1980's, to upgrade the quality and reliability of the data and to meet changing data needs. Beginning in April 1984, the old 1970 design was phased out through a series of changes that was completed in July 1985.

The March 1985 CPS sample consists of three rotation groups from the 1970 census files, four rotation groups from the 1980 census files, and one rotation group from both files. The coverage was in all 50 states and the District of Columbia. The sample is continually updated to reflect new construction. Due to the phase-in of the new design, the March 1985 CPS sample had three rotation groups located in 629 sample areas comprising 1,148 counties, independent cities, and minor civil divisions from the old design; and five rotation groups located in 729 sample areas comprising 1,973 counties and equivalent geographic areas in the United States from the new design. This current number of sample areas is not completely comparable to the old number of sample areas since many of the sample areas have been redefined. In this sample, approximately 59,5 0 occupied households were eligible for interview.[1] Of this number, about 2,500 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason. For a description of the previous CPS sample design and a more detailed explanation of the effects of the phase-in procedure on the March 1985 data, see the detailed reports in this series, Current Population Reports, Series P-20.

The following table provides a description of some aspects of the CPS designs in use during the referenced data collection period.

Description of the Current Population Survey

Time period	Number of sample areas[1]	Housing units eligible	
		Interviewed	Not interviewed
1985	629/729	57,000	2,500
1982–84	629	59,000	2,500
1980–81	629	65,500	3,000
1978–79	614	55,000	3,000
1973–77	461	46,500	2,500
1972	449	45,000	2,000
1967–71	449	48,000	2,000
1963–66	357	33,500	1,500
1960–62	[2]333	33,500	1,500
1957–59	330	33,500	1,500
1954–56	230	21,000	500–1,000
1948–53	68	21,000	500–1,000

[1] Beginning in May 1956, these areas were chosen to provide coverage in each state and the District of Columbia.

[2] Three sample areas were added in 1960 to represent Alaska and Hawaii after statehood.

CPS estimation procedure. The estimation procedure used in this survey involves the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, race, sex, and Spanish origin. These independent estimates are based on statistics from the decennial census of population; statistics on births, deaths, immigration, emigration; and statistics on the strength of the Armed Forces. Beginning with reports containing data for 1980, the independent population estimates used to obtain data for years after 1979 are based on the 1980 decennial census. Data for 1971 through 1979 were obtained using independent population estimates based on the 1970 decennial census. The estimation procedure for the data from the March supplement involves a further adjustment so that husband and wife of a household receive the same weight.

The estimates in this report for March of 1985 are also based on revised survey weighting procedures for persons of

---

[1] Numbers reflect the initial size of the CPS sample and do not include expansions for Hispanic households.

Spanish origin. In previous years the estimation procedures used in this survey involved the inflation of weighted sample results to independent estimates of the noninstitutional population by age, sex, and race. There was, therefore, no specific control of the survey estimates for the Hispanic population. During the last several years, the Bureau of the Census has developed independent population controls for the Hispanic population by sex and detailed age groups and has adopted revised weighting procedures to incorporate these new controls. It should be noted that the independent population estimates include some, but not all, illegal immigrants.

Decennial Census of Population. Decennial census data in this report are based on the complete counts or on the samples associated with the census. The 1970 census data, for example, are from special tabulations developed from the 5-percent sample associated with the 1970 Census of Population. Descriptions of the samples from censuses are found in the appropriate census publications. Specific references to data from census publications are noted in the body of the text.

Divorce rates. Data on divorce rates are obtained from the Vital Statistics Reports published by the National Center for Health Statistics.

RELIABILITY OF ESTIMATES

Since the CPS estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The accuracy of a survey result depends on both types of errors, but the full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates. The standard errors provided for the CPS estimates primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure any systematic biases in the data. (Bias is the difference, averaged over all possible samples, between the estimate and the desired value.)

Nonsampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage as compared to the level of the 1980 decennial census is about 7 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. Ratio estimation to independent age-sex-race Hispanic population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race Hispanic group. Further, the independent population controls used have not been adjusted for undercoverage in the 1980 census.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey,* Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology,* Bureau of the Census, U.S. Department of Commerce.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct confidence intervals, ranges that would include the average results of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

1. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples may or may not be contained in any particular computed interval. However, for a particular sample, one can say with specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in the report is that the population parameters are different. An example of this would be comparing the median age at first marriage of men to that of women. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the characteristics are different when, in fact, they are identical.

To perform the most common test, let x and y be sample estimates for two characteristics of interest. Let the standard error on the difference x-y be σ_{DIFF}. If the ratio $R = (x-y)/\sigma_{DIFF}$ is between -2 and +2, no conclusion about the difference between the characteristics is justified at the 0.05 level of significance. If, on the other hand, this ratio is smaller than -2 or larger than + 2, the observed difference is significant at the 0.05 level. In this event, it is commonly accepted practice to say that the characteristics are different. Of course, sometimes this conclusion will be wrong. When the characteristics are, in fact, the same, there is a 5-percent chance of concluding that they are different. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between characteristics is greater than twice the standard error of the difference. For the other differences mentioned, the estimated difference between characteristics is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison is qualified, e.g., by the use of the phrase "some evidence."

Comparability of data. Data obtained from the CPS and other governmental sources are not entirely comparable. This is due in large part to differences in interviewer training and experience and in differing survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources.

Caution should also be used when comparing estimates after 1979, which reflect 1980 census-based population controls, with estimates from earlier years. This change in population controls had relatively little impact on summary measures such as means, medians, and percent distributions, but did have a significant impact on levels. For example, use of 1980-based population controls resulted in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels after 1979 will differ from those for earlier years by more than what could be attributed to actual changes in the population and these differences could be disproportionately greater for certain subpopulation groups than for the total population. (It should be noted that 1980 data from Report P-20 No. 365 in this series used 1970-based population controls. Later reports using 1980 data used 1980-based controls.)

Care must also be taken when comparing Hispanic estimates overtime due to the recent change in weighting of the Hispanic population beginning in 1985. Before 1985, there were no independent population control totals for persons of Spanish origin.

Note when using small estimates. Summary measures (such as medians and percent distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each data user's needs. Also, care must be taken in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Standard errors for data based on the decennial census. Sampling errors of all data from the samples of the decennial censuses shown in this report are small enough to be disregarded.

Standard errors for divorce rates from the national center for health statistics. Data on number of divorces are from administrative records supplied by the individual states to NCHS and as such are not subject to sampling error.

Standard errors for data based on the CPS sample. In order to derive standard errors that would be applicable to a larger number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

Standard error tables and their use. The figures presented in tables C-1 through C-4 are approximations to the standard errors of various estimates for persons, families, households, and unrelated individuals shown in this report. To obtain the approximate standard error for a specific characteristic, the appropriate standard error in tables C-1 through C-4 must be multiplied by the factor for that characteristic given in table C-5. These factors, denoted f_1 in the formulas, must be applied to the generalized standard errors in order to adjust for the combined effect of the sample design and the estimating procedure on the value of the characteristic. Also, for estimates from the CPS before 1980, standard errors must be multiplied by an additional factor (f_2) noted in table C-6.

Standard errors for intermediate values not shown in the generalized tables of standard errors C-1 through C-4 may be approximated by linear interpolation.

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic; they are presented in table C-7. These parameters were used to calculate the standard errors in tables C-1 through C-4 and to calculate the factors in table C-5. They also may be used directly to calculate the standard errors for estimated numbers and percentages. Direct computation of the standard errors using table C-7 will give more accurate results than the use

Table C-1. Standard Errors of Estimated Numbers: Total or White

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
20..............	9	2,500...........	105
30..............	12	5,000...........	148
50..............	15	10,000..........	206
100.............	21	25,000..........	310
250.............	33	50,000..........	402
500.............	47	100,000[1]........	445
1,000...........	67		

Note: For a particular characteristic see tables C-5 and C-6 for the appropriate factor to apply to the above standard errors. For reference, the standard errors in tables C-1 and C-3 were calculated using a = -0.000025 and b = 4480.

[1] For estimates larger than 100,000,000, multiply the estimate by 0.004 to get the standard error. Use of formula (2) and the Parameters in table C-7 will give more accurate results.

Table C-2. Standard Errors of Estimated Numbers: Black or Spanish Origin

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
20..............	11	500.............	56
30..............	14	1,000...........	78
50..............	18	2,500...........	120
100.............	25	5,000...........	160
250.............	40	10,000[1].........	194

Note: For a particular characteristic see tables C-5 and C-6 for the appropriate factor to apply to the above standard errors. For reference, the standard errors in table C-2 and C-4 were calculated using a = -0.000265 and b = 6426.

[1] For estimates larger than 10,000,000, multiply the estimate by 0.019 to get the standard error. Use of formula (2) and the parameters in table C-7 will give more accurate results.

of the standard error tables (C-1 through C-4). Methods for computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, σ_x, of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f_1 f_2 \sigma \qquad (1)$$

where f_1 is the appropriate factor from table C-5, f_2 is the appropriate factor from table C-6 for the year of the estimate, and σ is the standard error on the estimate obtained by interpolation from table C-1 or C-2. Alternatively, the standard error may be approximated by formula (2) from which the standard errors in table C-1 or C-2 were calculated. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = f_2 \sqrt{ax^2 + bx} \qquad (2)$$

Here x is the size of the estimate, f_2 is the appropriate factor from table C-6, and a and b are the parameters in table C-7 associated with the particular characteristic. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the f_1 factor or set of parameters for the characteristic which will give the largest standard error.

Illustration of the computation of the standard error of an estimated number. Table A-13 of this report shows that there were 1,983,000 unmarried-couple households as of March 1985. Using formula (2), the factor f_2 = 1.0, and the parameters a = -0.000010 and b = 1778 from table C-7, the estimate of the standard error is

$$\sigma_x = 1.0\sqrt{(-0.000010)(1{,}983{,}000)^2 + (1778)(1{,}983{,}000)}$$
$$\doteq 59{,}000^{2}$$

The 95-percent confidence interval for the number of unmarried couple households is 1,865,000 to 2,101,000 (using twice

Table C-3. Standard Errors of Estimated Percentages: Total or White

Base of estimated percentage (thousands)	Estimated percentage						
	1 or 99	2 or 98	5 or 95	10 or 90	15 or 85	25 or 75	50
100..................	2.1	3.0	4.6	6.3	7.6	9.2	10.6
250..................	1.3	1.9	2.9	4.0	4.8	5.8	6.7
500..................	0.9	1.3	2.1	2.8	3.4	4.1	4.7
1,000................	0.7	0.9	1.5	2.0	2.4	2.9	3.3
2,500................	0.4	0.6	0.9	1.3	1.5	1.8	2.1
5,000................	0.3	0.4	0.7	0.9	1.1	1.3	1.5

50,000...............	0.09	0.13	0.2	0.3	0.3	0.4	0.5
100,000..............	0.07	0.09	0.15	0.2	0.2	0.3	0.3
200,000..............	0.05	0.07	0.10	0.14	0.2	0.2	0.2

Note: For a particular characteristic, see tables C-5 and C-6 for the appropriate factor to apply to the above standard errors.

---

[2] Using formula (1), the appropriate factor for f_1 (0.6) from table C-5, the appropriate factor for f_2 (1.0) for 1985, and interpolation from table C-1, the approximate standard error is (0.6)(1.0)(92,000) = 55,000.

Table C-4. Standard Errors of Estimated Percentages: Black or Spanish Origin

Base of estimated percentage (thousands)	Estimated percentage						
	1 or 99	2 or 98	5 or 95	10 or 90	15 or 85	25 or 75	50
100..................	2.5	3.5	5.5	7.6	9.1	11.0	12.7
250..................	1.6	2.2	3.5	4.8	5.7	6.9	8.0
500..................	1.1	1.6	2.5	3.4	4.0	4.9	5.7
1,000................	0.8	1.1	1.7	2.4	2.9	3.5	4.0

10,000...............	0.3	0.4	0.6	0.8	0.9	1.1	1.3
25,000...............	0.2	0.2	0.3	0.5	0.6	0.7	0.8

Note: For a particular characteristic, see tables C-5 and C-6 for the appropriate factor to apply to the above standard errors.

the standard error). Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factors or parameters indicated by the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula:

$$\sigma_{(x,p)} = f_1 f_2 \sigma \qquad (3)$$

In this formula, f_1 is the appropriate factor from table C-5, f_2 is the appropriate factor from table C-6, and σ is the standard error on the estimate from table C-3 or C-4. Alternatively, the standard error may be approximated by the following formula from which the standard errors in table C-3 or C-4 were calculated. Use of this formula will give more accurate results than use of formula (3) above.

Table C-5. Factors f_1 to be Applied to Tables C-1 through C-4 to Estimate Standard Errors

Characteristic	Persons	Families, households, and unrelated individuals
Total or White:		
United States, regional, and metropolitan..............	1.0	0.6
Nonmetropolitan.................	1.2	0.8
Black and other races:		
United States, regional, and metropolitan..............	1.0	0.5
Nonmetropolitan.................	1.2	0.6
Spanish origin:		
United States, regional, and metropolitan..............	1.0	0.5
Nonmetropolitan.................	1.2	0.6

Table C-6. Factors f_2 to be Applied to Tables C-1 through C-4 and C-7 to Estimate Standard Errors of Estimates by Year

Year of estimate	f_2 factor
1980-85..	1.00
1967-79..	0.88
1956-66..	1.08
1948-55..	1.33

$$\sigma_{(x,p)} = f_2 \sqrt{(b/x)\ p\ (100-p)} \qquad (4)$$

Here x is the size of the subclass of persons or households which is the base of the percentage, f_2 is the appropriate factor from table C-6, p is the percentage ($0 < p < 100$), and b is the parameter in table C-7 associated with the particular characteristic in the numerator of the percentage.

Illustration of the computation of the standard error of a percentage. Table A-13 of this report shows that of the 1,983,000 unmarried-couple households, 1,380,000, or 69.6 percent, have no children present. From table C-7, the approximate "b" parameter is 1778. Using formula (4), the approximate standard error of 69.6 percent is

$$\sigma_{(x\text{-}p)} = 1.0 \sqrt{(1778/1{,}983{,}000)(69.6)(100\text{-}69.6)}$$

$$\pm 1.4 \text{ percent}^{3}$$

This means that the 95-percent confidence interval for the percentage of unmarried-couple households with no children present is from 66.8 to 72.4 percent, i.e., 69.6 ± (2 x 1.4).

---

[3] Using formula (3), the appropriate factor for f_1 from table C-5 (0.6), the appropriate factor for f_2 for 1985 (1.0), and table C-3, the approximate standard error is (0.6)(1.0)(2.3) = 1.4 percent.

Table C-7. "a" and "b" Parameters for Calculating Approximate Standard Errors

Characteristic	Persons		Families, households, and unrelated individuals	
	a	b	a	b
Total or White:				
United States, regional, and metropolitan......	-0.000025	4480	-0.000010	1778
Nonmetropolitan....	-0.000038	6720	-0.000015	2667
Black and other races:				
United States, regional, and metropolitan.....	-0.000265	6426	-0.000066	1606
Nonmetropolitan....	-0.000398	9639	-0.000099	2409
Spanish origin:				
United States, regional, and metropolitan.....	-0.000548	6426	-0.000137	1606
Nonmetropolitan...	-0.000822	9639	-0.000206	2409

Note: After computing the part of the appropriate standard error formula inside the square root, multiply by the appropriate f_2 factor shown in table C-6.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} \qquad (5)$$

where σ_x and σ_y are the standard errors of the estimates x and y, respectively. The estimates can be of numbers, percentages, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the computation of the standard error of a difference. Table A-13 shows that in 1985 there were 603,000 unmarried-couple households with children under 15 years and that in 1980 there were 431,000. The apparent difference between 1980 and 1985 unmarried-couple households with children present under 15 years is 172,000. Using formula (2) and the appropriate parameters from table C-7, the approximate standard errors of these two estimates are 33,000 and 28,000, respectively.[4] Therefore, from formula (5), the approximate standard error of the estimated difference of 172,000 households is

$$\sigma_{(x-y)} = \sqrt{(33,000)^2 + (28,000)^2} \doteq 43,000$$

This means that the 95-percent confidence interval for the true difference between unmarried-couple households with children present under 15 years in 1985 and in 1980 is from 86,000 to 258,000. Therefore, a conclusion that the average estimate of the difference derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples. Since this interval does not contain zero, we can conclude with 95-percent confidence that the number of unmarried-couple households with children present under 15 is greater in 1985 than in 1980.

Standard error of a ratio. The standard error of a ratio, e.g., ratios of single men to single women or estimates of the number of divorced persons per 1,000 married persons with spouse present, cannot be calculated directly from the standard error tables. For example, the estimate of divorced persons per thousand married persons with spouse present involves the ratio of the total persons divorced, x, to the total number of married persons with spouse present, y, multiplied

NA Not available.

[1] Persons of Spanish origin may be of any race.

Source of 1970 data for Spanish origin: U.S. Bureau of the Census, 1970 Census of Population, PC(2)1C, Persons of Spanish Origin.

Source of 1960 data: U.S. Bureau of the Census, for all races, Current Population Reports, Series P-20, No. 144, (White data by estimation); for Black, 1960 Census of Population, PC(2)1C, Nonwhite Population by Race.

by 1,000. The standard error of this estimate is calculated by the following formula:

$$\sigma_{[(x/y)(1,000)]} = 1,000 \sqrt{(x/y)^2 [(\sigma_x^2/x^2) + (\sigma_y^2/y^2)]} \qquad (6)$$

The standard error of the estimated ratio of the number of single men, x, to single women, y, uses the same formula, but must be multiplied by 100 rather than 1,000. The standard errors of the estimates of the total number of divorced persons, or number of single men, σ_x, and the standard error of the total number of married persons with spouse present, or number of single women, σ_y, should both be calculated by using table C-1 or C-2 and the factors from tables C-5 and C-6, or by using formula (2).

Illustration of the computation of the standard error of estimated divorced persons per 1,000 married persons with spouse present. Table C-9 of this report shows that in 1985, the number of divorced persons, x, was 13,089,000 and the number of married persons with spouse present, y, was 102,229,000. This means that the ratio of divorced persons to married persons who were living with their spouses was 128 per 1,000, as shown in table A-5. The standard error of this estimate is calculated by using formula (6) and the following steps:

1. Compute σ_x and σ_y using formula (2).

$$\sigma_x = 1.0 \sqrt{(-0.000025)(13,089,000)^2 + (4480)(13,089,000)}$$

$$\doteq 233,000$$

$$\sigma_y = 1.0 \sqrt{(-0.000025)(102,229,000)^2 + (4480)(102,229,000)}$$

$$\doteq 444,000$$

2. Compute $\sigma_x^2/x^2 = 0.000317$

3. Compute $\sigma_{y^2/y^2} = 0.000019$

4. Using formula (6), the estimate of the standard error is

$$\sigma_{[(x/y)\ (1{,}000)]} = 1{,}000\sqrt{\frac{13{,}089{,}000}{102{,}229{,}000}^{2}(0.000317 + 0.000019)}$$
$$\doteq 2.3$$

This means that the 95-percent confidence interval for the ratio of divorced persons to married persons with spouse present is from about 123 to 133 per 1000.

Standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of an estimated median is to determine a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.) The following procedure may be used to estimate the 68-percent confidence limits, and hence the standard error, of a median based on sample data.

(1) Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution.

(2) Add to and subtract from 50 percent the standard error determined in step (1).

(3) Using the distribution of the characteristic, calculate the 68-percent confidence interval by calculating the values corresponding to the two points established in step (2).

Use the formula below and the tabulated cumulative relative distribution of the characteristic to interpolate between values.

$$X = \frac{(L-A_1)}{(A_2-A_1)} \times (T_2 - T_1) + T_1 \qquad (7)$$

where X = the interpolated estimate of the upper or lower limit;
L = the upper or lower limit obtained from step (2);
A_1 and A_2 = the lower and upper values of the cumulative relative frequency for the limits of the interval which contains L; and
T_1 and T_2 = the lower and upper values of the characteristic in the interval which contains L

(4) Once the limits of the 68-percent confidence interval are computed, the standard error of a median can be computed by the formula:

$$\sigma_{median} = (X_U - X_L) / 2$$

where X_U = upper limit of the 68-percent confidence interval,
X_L = lower limit of the 68-percent confidence interval.

This method can also be used to compute a 95-percent confidence interval by adding to and subtracting from 50 percent, twice the standard error in step (2), above.

Illustration of the computation of a confidence interval for a median. Table A-7 of this report shows that the median age for men living alone in 1985 was 41.4 years. Table A-7 also indicates that the base of the distribution from which this median was determined is 7,922,000 men living alone.

(1) Using the formula (4), and the appropriate b-parameter from table C-7, the standard error of 50 percent on a base of 7,922,000 is

$$1.0\sqrt{\frac{4{,}480}{7{,}922{,}000}(50.0)(100\text{-}50.0)} \doteq 1.4 \text{ percent.}$$

(2) To obtain a 68-percent confidence interval on an estimated median, add to and subtract from 50 percent the standard error found in step (1). This yields percentage limits of 48.6 and 51.4.

(3) Since 38.7 percent of men living along were under 35 years of age and 56.4 percent were under 45 (from the detailed tables), the lower limit of the estimate may be found, by using formula (7), to be

$$\frac{48.6-38.7}{56.4-38.7} \times (45\text{-}35) + 35 = 40.6.$$

Similarly, since the 51.4 percentage falls within the same age category, the upper limit of the estimate may be found to be

$$\frac{51.4-38.7}{56.4-38.7} \times (45\text{-}35) + 35 = 42.2.$$

Thus, an approximated 68-percent confidence interval for the median age of men living alone is from 40.6 to 42.2 years.

(4) Applying formula (8), the standard error of the median can be approximated:

$$\sigma_{median} = \frac{42.2-40.6}{2} = 0.8 \text{ years.}$$

For detailed age breakdowns for years prior to 1985, see the earlier reports in this series (P-20).

Current Population Reports—Households, Families, and Marital Status

Series P-20—Population Characteristics

No. 3 Changes in Number of Households and in Marital Status, 1940 to 1947
No. 10 Characteristics of Single, Married, Widowed, and Divorced Persons in 1947
No. 11 Household Composition and Characteristics in 1947, for Urban and Rural Areas and Regions
No. 16 Households by Type, Composition, and Housing Characteristics in 1947
No. 17 Characteristics of Families and Subfamilies in the U.S., in April 1947
No. 21 Characteristics of Households, Families, and Individuals: April 1948
No. 23 Marital Status, Number of Times Married, and Duration of Present Marital Status: April 1948
No. 25 Changes in Number of Households and in Marital Status: 1940 to 1949
No. 26 Marital Status and Household Characteristics: April 1949
No. 31 American Households Continue Decline in Size
No. 32 Children and Youth: 1950
No. 33 Marital Status and Household Characteristics: March 1950
No. 35 Changes in Marital Status and in Number of Households: 1890 to 1951
No. 38 Marital Status and Household Characteristics: April 1951
No. 41 Average Size of American Households Drops Sharply: April 1952
No. 42 Projections of the Number of Households and Families: 1955 and 1960
No. 44 Marital Status and Household Characteristics: April 1952
No. 48 Households Increasing 950,000 Per Year: 1953
No. 50 Marital Status, Year of Marriage, and Household Relationship: April 1953
No. 53 Household and Family Characteristics: April 1953
No. 55 Households and Families, by Type: 1947 to 1954
No. 56 Marital Status and Family Status: April 1954
No. 59 Households and Families, by Type: 1947 to 1955
No. 62 Marital Status and Family Status: April 1955
No. 67 Household and Family Characteristics: April 1955 and 1954
No. 68 Households and Families, by Type: 1950 to 1956
No. 69 Projections of the Number of Households and Families: 1960 to 1975
No. 72 Marital Status and Family Status: March 1956
No. 75 Household and Family Characteristics: March 1956
